

Sets

Sets are created using the Set popup at the bottom of the List Screen. By selecting the Set Manager, a user can perform the following operations on a set:

New Set – Creates a new set of records.

Clear Set – Clears the selected set.

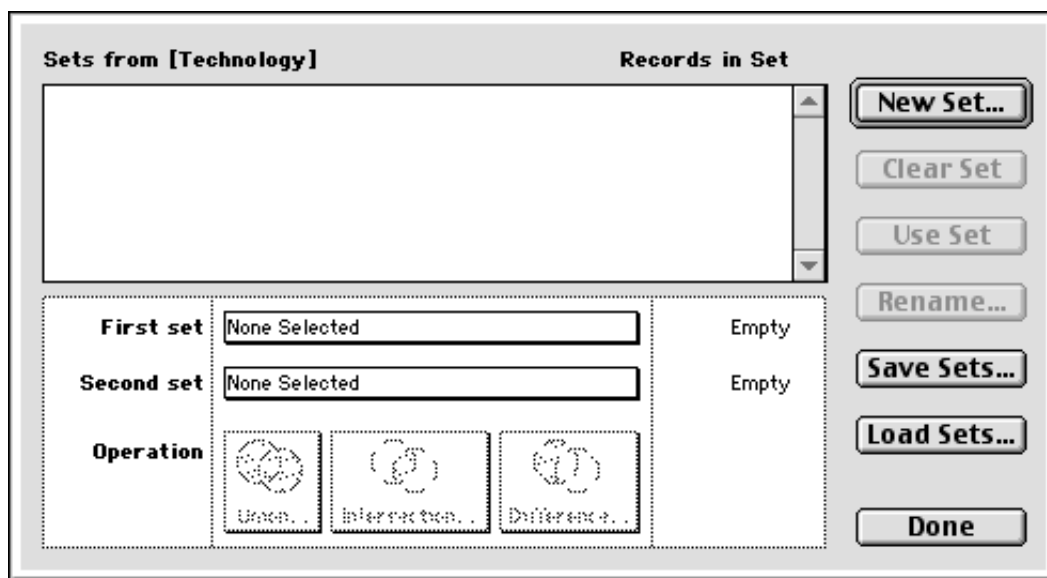

Use Set – Returns the user to the List Screen with the selected set as the current selection.

Rename – Renames the set.

Save Sets... - Saves the set to disk.

Load Sets... - Loads a set from disk.

Done – Closes the Set Manager window.

The following message is displayed when a set is saved to disk for the first time:

The reason this message is displayed is to inform users that sets may become unreliable over a period of time. When a set is saved to disk, the actual records are not saved. A reference to the record is saved instead. If records are added to the set, deleted or modified, the validity of the set may be jeopardized.
